## **ABSTRACT**

The invention is an improved fuel cell system suited for Specifically, a vehicle. the invention application in provides an improved system to remove CO emissions that has a rapid dynamic response (about 1 second) and can operate over a temperatures (between 0 800 range of and The fuel cell system comprises hydrogen fuel, a CO removal system based upon non-Faradaic electrochemical modification of catalyst activity (electrochemical promotion), and a fuel cell stack. The CO removal system comprises a catalyst/working electrode, an electrolyte, counter electrode, and a power source. The CO removal system's intrinsic catalytic rate is greater than an intrinsic electrocatalytic rate. The catalyst can be Pt, Cu/ZnO, Cu/CuO, ABO3 (perovskite), zeolite, and Pd. The power source can be a battery, potentiostat, or galvanostat.
